

ADD A VIDEO TO A PAGE WITH VISUAL COMPOSER

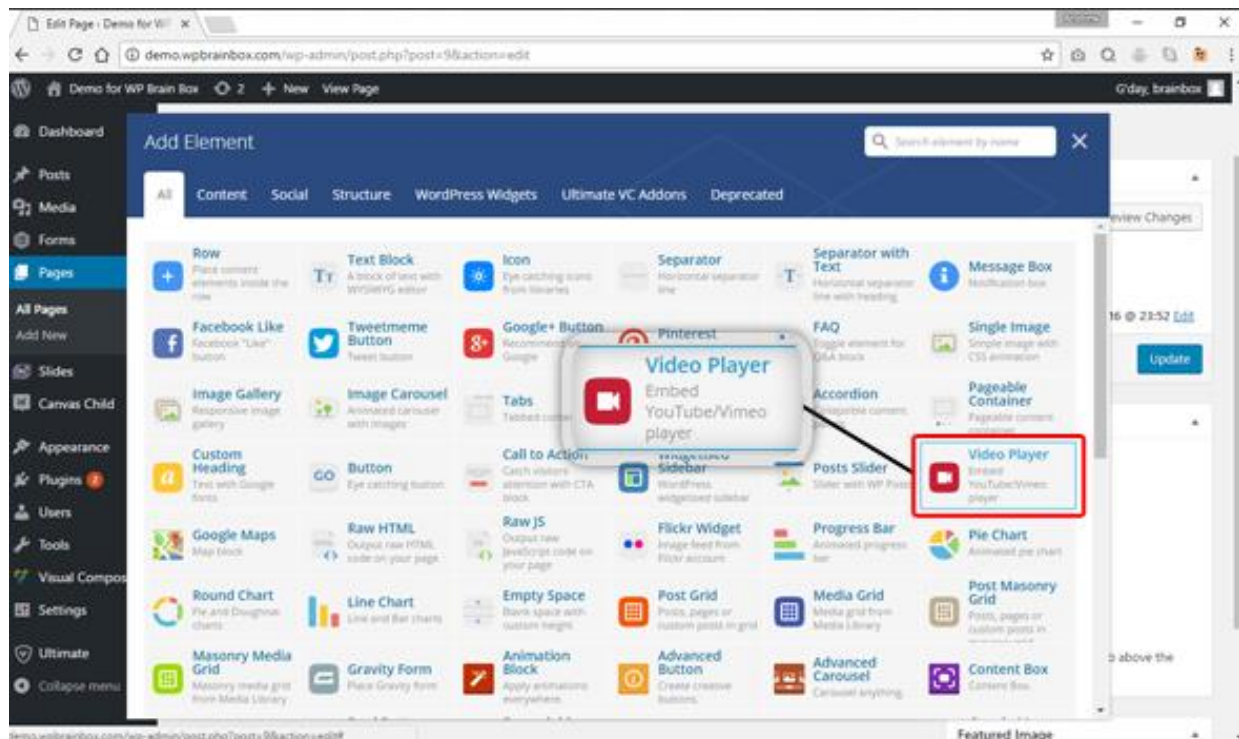

Embedding a video to a page is really easy once the video is on **YouTube** or **Vimeo**. Now, let's place a video player element to our page.

Step 1: Add a column for the video

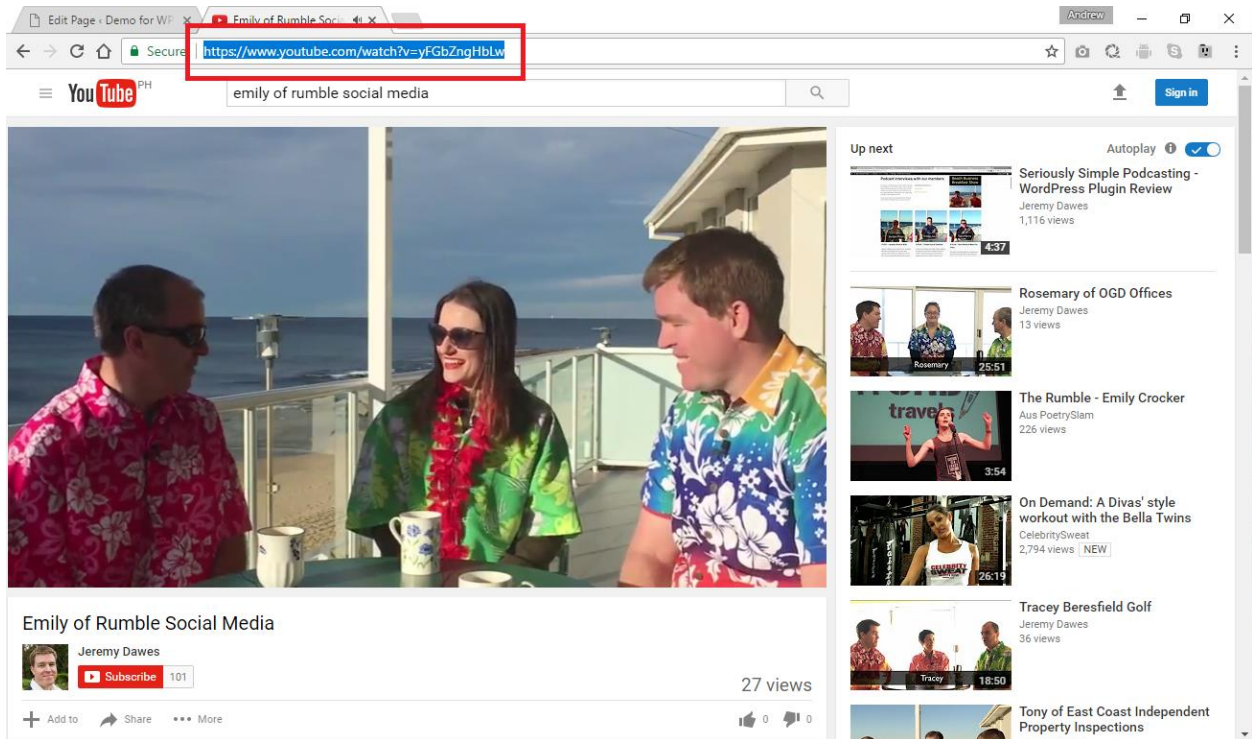

First, we need to be in the back-end editor of the Visual Composer. To add a video player element to our page, click on the + icon.

Step 2: Select video player element

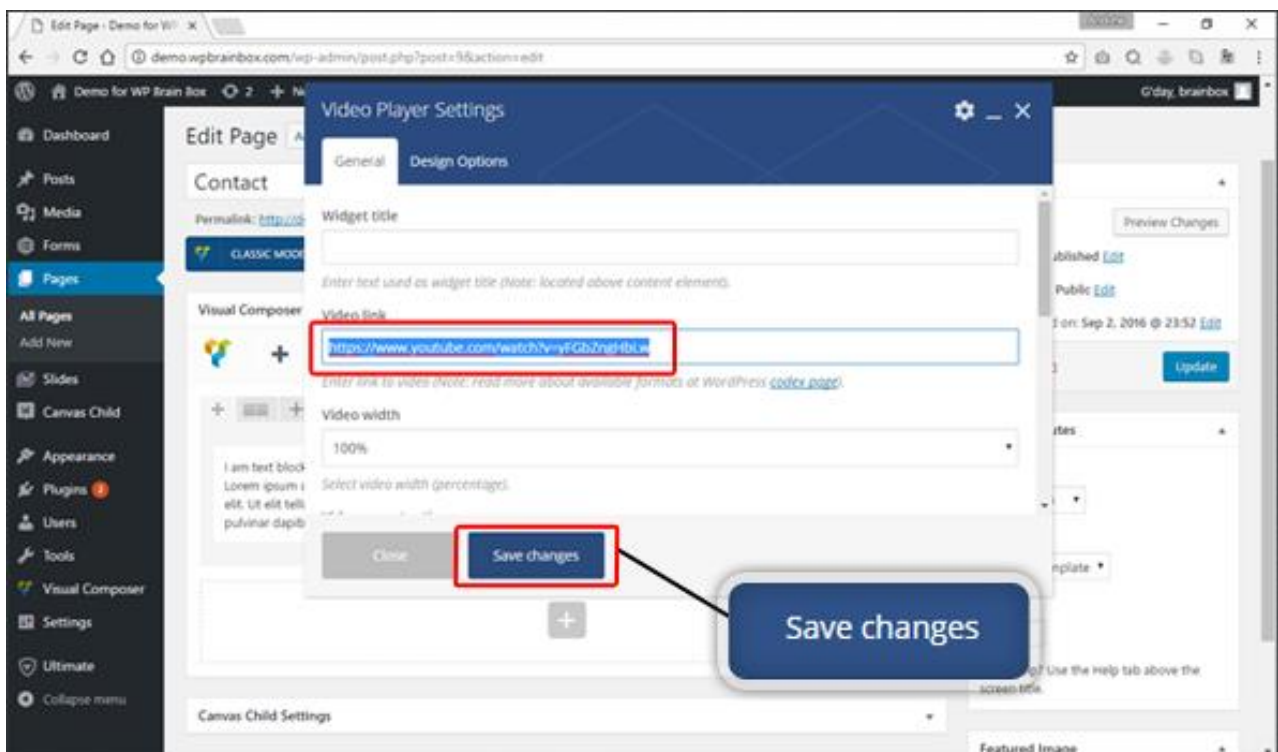

After clicking the + icon, the **Add Element** box will appear. Select the video player element. If you're having a hard time finding the video player element, click on the **Content** tab to filter out the elements or search it on the search at the upper-rightmost side.

Step 3: Get the link of the video

Get the link of the video you want to be embedded in your page. It is at the address bar located at the top portion of the page. Paste this link as the **Video Link** property of the video player setting.

Step 4: Edit the video link property and save changes

After selecting the video player element, a video player setting will appear. The only thing we have to worry about for a basic video embed is to remove the temporary link that the Visual Composer has set. Afterwards, let's paste the link of the video that we prefer and click the **Save Changes** button. After that, close the **Video Player Setting** and click **Update** button to update your page.

Output

Video successfully embedded
